

Geotech AQMESH

AQMesh measures air quality precisely where it is required. Battery-powered for months or years and with wireless communication, readings are processed on the cloud and accessed online.

Gases NO, NO₂, O₃ and CO are measured using the latest electrochemical sensors, with a sensitivity of 5ppb. Particles are counted using a light scattering optical particle counter.

AQMesh is manufactured in the UK by Geotech and was developed in partnership with a team from the University of Cambridge.

Installation of each AQMesh pod takes around 10 minutes and readings are available in near real-time.

AQMesh has been co-located with reference stations around the world since 2013, demonstrating high performance.
